Time-varying suspended sediment-discharge rating curves to estimate climate impacts on fluvial sediment transport in the Esopus Watershed

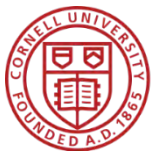

■ Introduction

$$\log Tn_t = \beta_0 + \beta_1 \times \log Q_t + \varepsilon_t$$

Objectives of the presentation

1. Understand how the Esopus Creek rating curve has evolved over time
2. Model the underlying causes of time-varying rating curve behavior to support long-term simulation studies

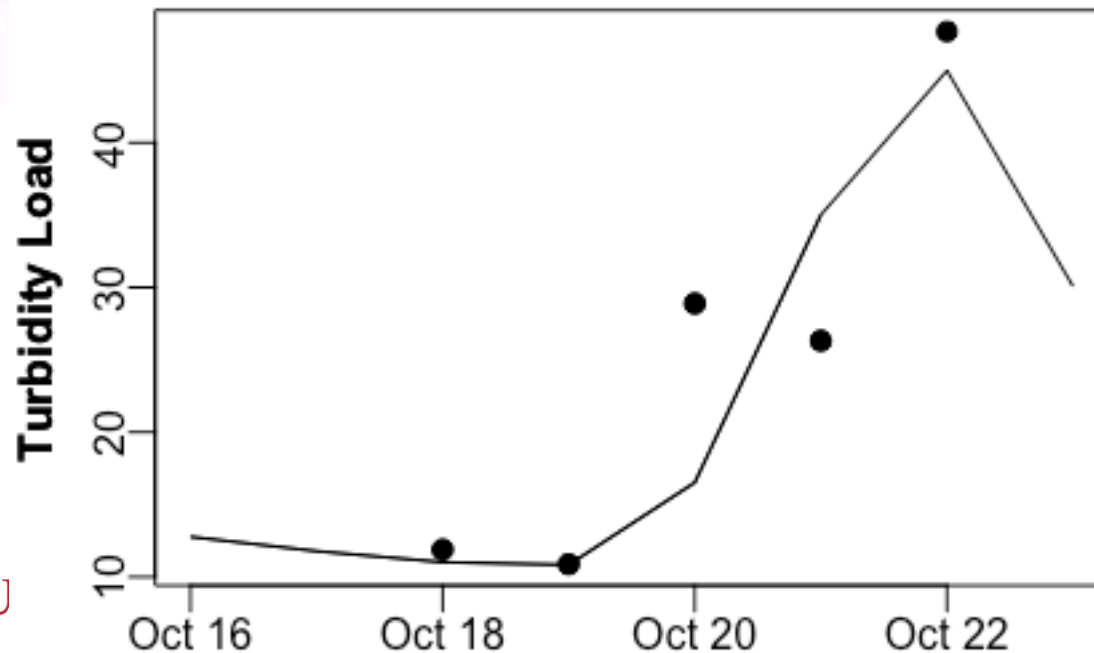

Objective 1

□ Understand how rating curve has varied in the past
(Dynamic Linear Models)

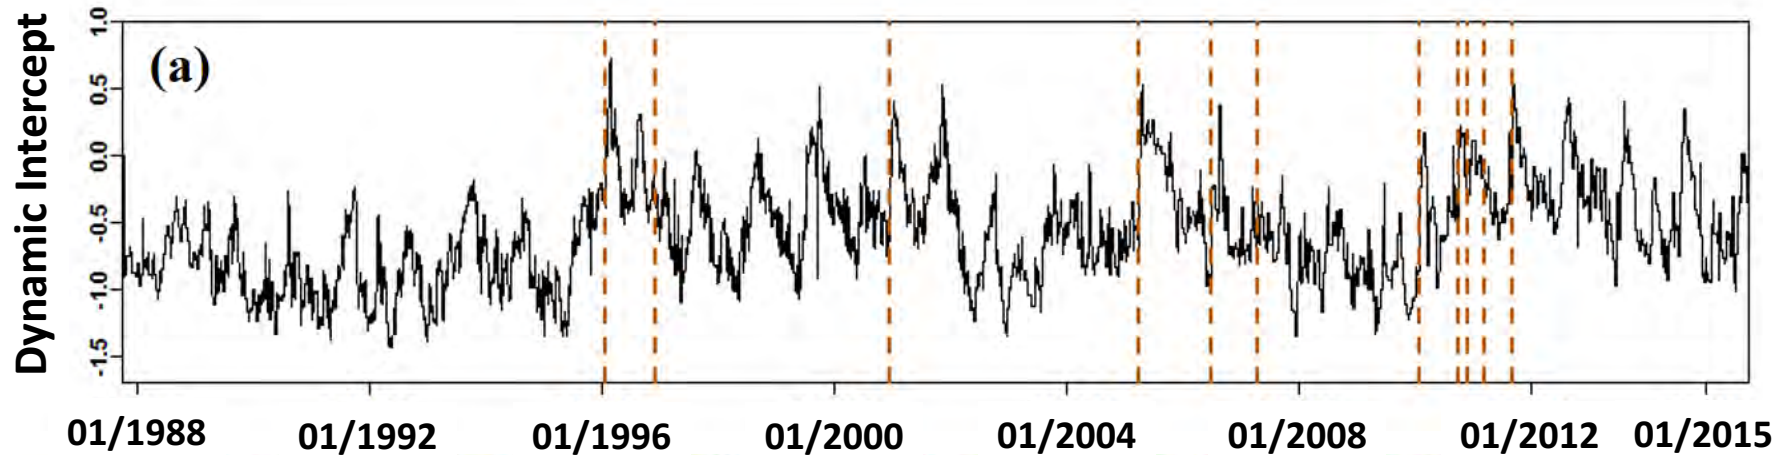

$$\log Tn_t = \beta_{0_t} + \beta_1 \log Q_t + \varepsilon_t \quad \varepsilon_t \sim \mathcal{N}(0, \sigma_\varepsilon^2)$$

↙ Coefficient is a
random walk

$$\beta_{0_t} = \beta_{0_{t-1}} + w_t \quad w_t \sim \mathcal{N}(0, \sigma_w^2)$$

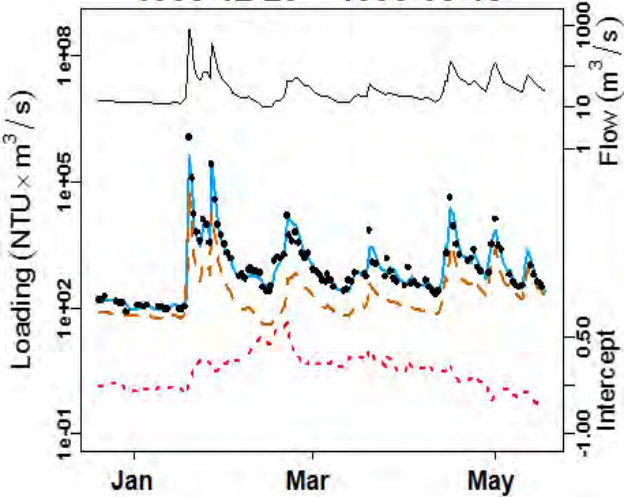

Time-varying intercept

■ Objective 2

□ Develop a time-varying rating curve model for future

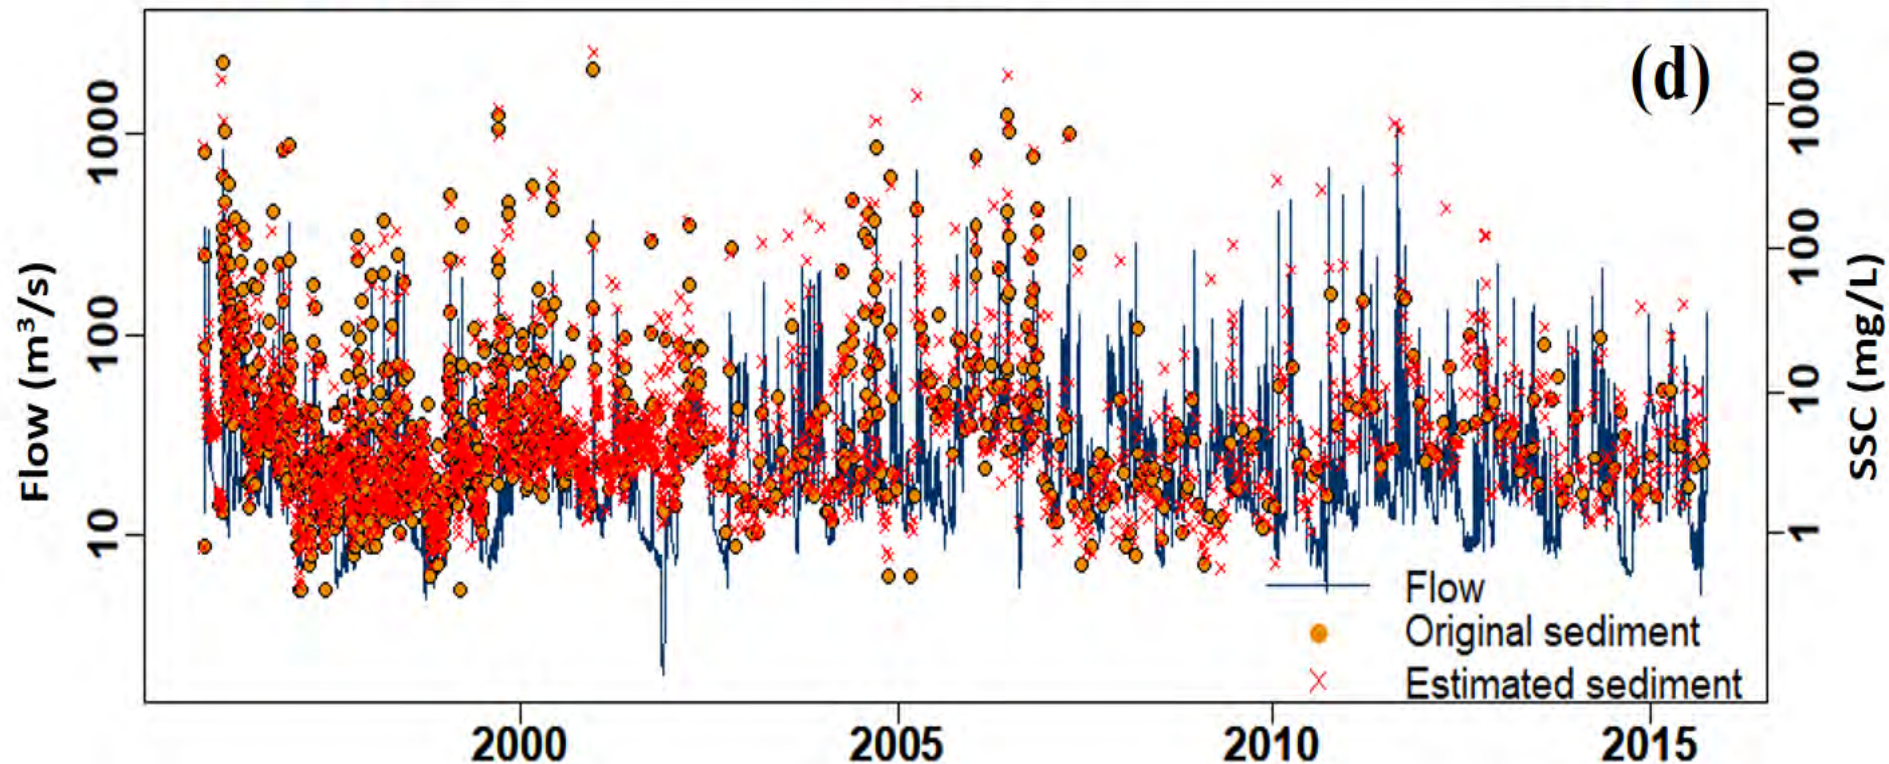

Methodology

Dynamic Linear Model (DLM) for SSC-Tn Relationship

$$\log SSC_t = \theta_{0,t} + \theta_1 \log T_{n_t} + \varepsilon_t \quad \varepsilon_t \sim \mathcal{N}(0, \sigma_\varepsilon^2)$$

$$\theta_{0,t} = \theta_{0,t-1} + w_t \quad w_t \sim \mathcal{N}(0, \sigma_w^2)$$

■ Inter-Model Comparison

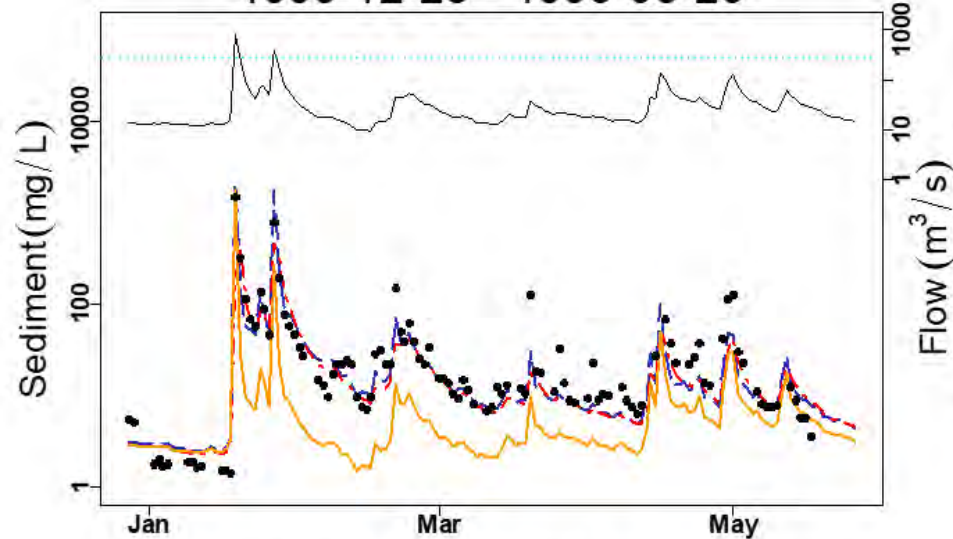

Model	Model Equation	Time-varying Intercept
M ₁	$\log rSSC_t = \beta_0 + \beta_1 \log Q_{w_t} + \beta_2 \sin(2\pi i_t) + \beta_3 \cos(2\pi i_t) + \varepsilon_t$	No
M ₂	$\log rSSC_t = \beta_0 + \beta_1 \log Q_w + \beta_2 \sin(2\pi i_t) + \beta_3 \cos(2\pi i_t) + \beta_4 \log \widehat{Q_{s_{t-1}}} + \varepsilon_t$	No
M ₃	$\log rSSC_t = \beta_0 + \beta_1 \log Q_w + \beta_2 \sin(2\pi i_t) + \beta_3 \cos(2\pi i_t) + \beta_5 \frac{d \log Q_{w_t}}{dt} + \varepsilon_t$	No
M ₄	$\log rSSC_t = \beta_0 + \beta_{0,t-1}^* + \beta_1 \log Q_{w_t} + \beta_2 \sin(2\pi i_t) + \beta_3 \cos(2\pi i_t) + \varepsilon_t$	Yes
M ₅	$\log rSSC_t = \beta_0 + \beta_{0,t-1}^* + \beta_1 \log Q_{w_t} + \beta_2 \sin(2\pi i_t) + \beta_3 \cos(2\pi i_t) + \beta_4 \log \widehat{Q_{s_{t-1}}} + \varepsilon_t$	Yes
M ₆	$\log rSSC_t = \beta_0 + \beta_{0,t-1}^* + \beta_1 \log Q_{w_t} + \beta_2 \sin(2\pi i_t) + \beta_3 \cos(2\pi i_t) + \beta_5 \frac{d \log Q_{w_t}}{dt} + \varepsilon_t$	Yes

$$\beta_{0,t}^* = \varphi_1 \beta_{0,t-1}^* + \varphi_{2,t} (\log Q_{w_t} - \log Q_{threshold})$$

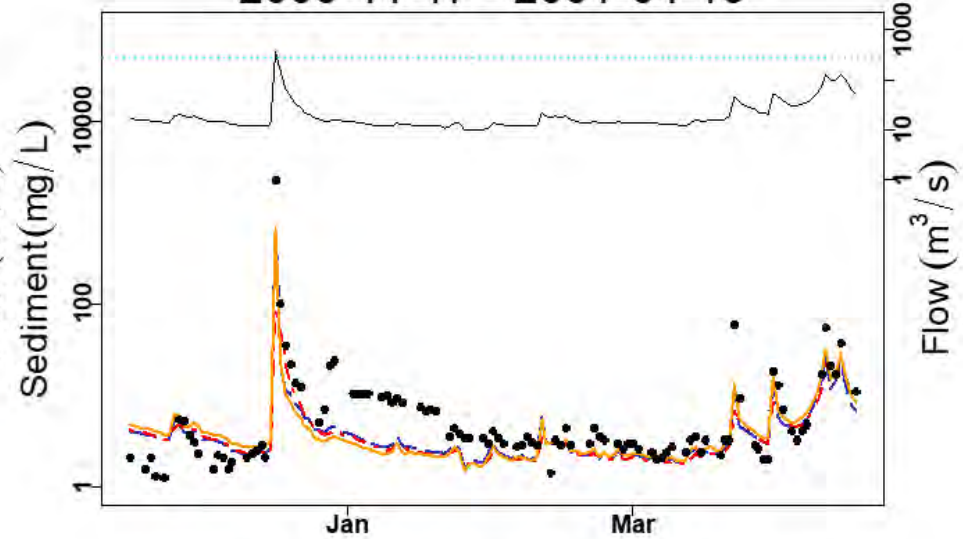

$$\varphi_{2,t} = \begin{cases} 0 & \forall Q_{w_t} < Q_{threshold} \\ \gamma & \forall Q_{w_t} \geq Q_{threshold} \end{cases}$$
